## Description

This weather dashboard application allows a user to search for cities by name, and shows the user the current and forecasted weather conditions in those cities for 5 days in the future. The app also saves the user's search history for up to 10 cities in local storage, allowing him or her to easily click back to a previously searched city and check the weather there.

Weather information shown includes:

- temperature
- humidity
- wind speed (current only)
- UV index (current only)
- graphical representation of weather conditions

The weather dashboard can be viewed here: <https://angelagongli.github.io/weather-dashboard/>

## Usage

Check the weather in multiple cities

## Contributing

PRs welcome

## Questions

Q: What if two cities have the same name?

A: First search result returned by OpenWeatherMap is shown
